Statistical Analysis

Chapter 8 : **Fundamental Sampling Distributions and Data Descriptions**

Chapter 9 : **One- and Two-Sample Estimation Problems (Mean and Variance)**

Chapter 10 : **One- and Two-Sample Tests of Hypotheses (Mean and Variance)**

Chapter 11 : **Simple Linear Regression and Correlation**

Agenda

- Review
- Standard Normal Distribution
- Sampling Distributions and Data Descriptions

Review

Important Definitions

Sample Space : The set of all possible outcomes of a statistical experiment is called the sample space and is represented by the symbol **S**.

Event : An event is a subset of a sample space.

The probability of an event A : is the sum of the weights of all sample points in A. Therefore,

$$0 \leq P(A) \leq 1,\ P(\varphi) = 0, \text{ and } P(S) = 1.$$

Random Variable

A **random variable :** is a function that associates a real number with each element in the sample space.

$$S = \{NNN, NND, NDN, DNN, NDD, DND, DDN, DDD\}$$

the number of defectives that occur

0, 1, 2, 3

Probability Function

The set of ordered pairs $(x, f(x))$ is a **probability function**, **probability mass function**, or **probability distribution** of the discrete random variable X if, for each possible outcome x,

1. $f(x) \geq 0$,
2. $\sum_x f(x) = 1$,
3. $P(X = x) = f(x)$.

The function $f(x)$ is a **probability density function** (pdf) for the continuous random variable X, defined over the set of real numbers, if

1. $f(x) \geq 0$, for all $x \in R$.
2. $\int_{-\infty}^{\infty} f(x)\, dx = 1$.
3. $P(a < X < b) = \int_a^b f(x)\, dx$.

Joint Probability Distributions

The function $f(x, y)$ is a **joint probability distribution** or **probability mass function** of the discrete random variables X and Y if

1. $f(x, y) \geq 0$ for all (x, y),
2. $\sum_x \sum_y f(x, y) = 1$,
3. $P(X = x, Y = y) = f(x, y)$.

For any region A in the xy plane, $P[(X, Y) \in A] = \sum \sum_A f(x, y)$.

The function $f(x, y)$ is a **joint density function** of the continuous random variables X and Y if

1. $f(x, y) \geq 0$, for all (x, y),
2. $\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x, y)\, dx\, dy = 1$,
3. $P[(X, Y) \in A] = \int \int_A f(x, y)\, dx\, dy$, for any region A in the xy plane.

Joint Probability Distributions (Independent RVs)

Let X and Y be two random variables, discrete or continuous, with joint probability distribution $f(x, y)$ and marginal distributions $g(x)$ and $h(y)$, respectively. The random variables X and Y are said to be **statistically independent** if and only if

$$f(x, y) = g(x)h(y)$$

for all (x, y) within their range.

Let $X_1, X_2, \ldots, X_n$ be n random variables, discrete or continuous, with joint probability distribution $f(x_1, x_2, \ldots, x_n)$ and marginal distribution $f_1(x_1), f_2(x_2), \ldots, f_n(x_n)$, respectively. The random variables $X_1, X_2, \ldots, X_n$ are said to be mutually **statistically independent** if and only if

$$f(x_1, x_2, \ldots, x_n) = f_1(x_1)f_2(x_2)\cdots f_n(x_n)$$

for all $(x_1, x_2, \ldots, x_n)$ within their range.

Mathematical Expectation

$$\mu = E(X) = \sum_x x f(x)$$

$$\mu = E(X) = \int_{-\infty}^{\infty} x f(x)\, dx$$

The variance of a random variable X is

$$\sigma^2 = E(X^2) - \mu^2.$$

Mathematical Expectation (Independent RVs)

If $X_1, X_2, \ldots, X_n$ are independent random variables having normal distributions with means $\mu_1, \mu_2, \ldots, \mu_n$ and variances $\sigma_1^2, \sigma_2^2, \ldots, \sigma_n^2$, respectively, then the random variable

$$Y = a_1X_1 + a_2X_2 + \cdots + a_nX_n$$

has a normal distribution with mean

$$\mu_Y = a_1\mu_1 + a_2\mu_2 + \cdots + a_n\mu_n$$

and variance

$$\sigma_Y^2 = a_1^2\sigma_1^2 + a_2^2\sigma_2^2 + \cdots + a_n^2\sigma_n^2.$$

Standard Normal Distribution

Example 6.2:

Given a standard normal distribution, find the area under the curve that lies

(a) to the right of $z = 1.84$ *and*

(b) between $z = -1.97$ *and* $z = 0.86$.

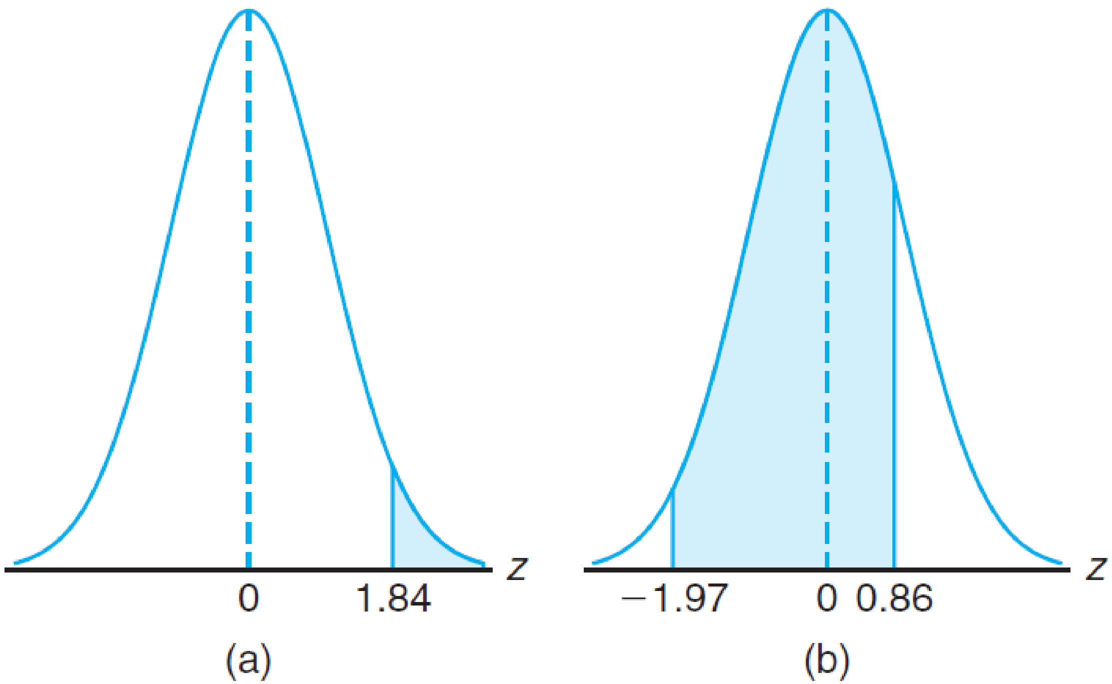

Figure 6.9: Areas for Example 6.2.

(a) The area in Figure 6.9(a) to the right of $z = 1.84$ is equal to 1 minus the area in Table A.3 to the left of $z = 1.84$, namely, $1 - 0.9671 = 0.0329$.

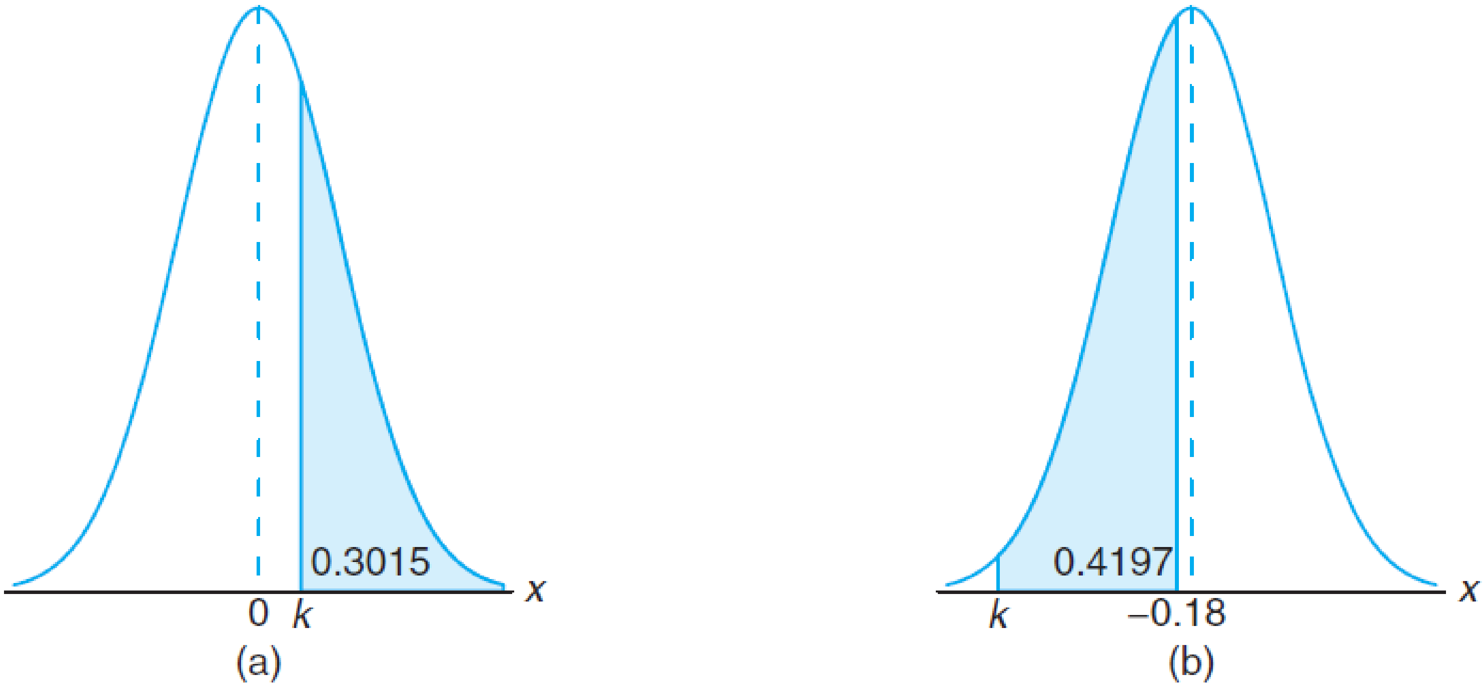
(b) The area in Figure 6.9(b) between $z = -1.97$ and $z = 0.86$ is equal to the area to the left of $z = 0.86$ minus the area to the left of $z = -1.97$. From Table A.3 we find the desired area to be $0.8051 - 0.0244 = 0.7807$.

Example 6.3:

Given a standard normal distribution, find the value of k *such that*

(a) $P(Z > k) = 0.3015$ *and*

(b) $P(k < Z < -0.18) = 0.4197$.



Distributions and the desired areas are shown in Figure 6.10.

(a) In Figure 6.10(a), we see that the k value leaving an area of 0.3015 to the right must then leave an area of 0.6985 to the left. From Table A.3 it follows that $k = 0.52$.

(b) From Table A.3 we note that the total area to the left of -0.18 is equal to 0.4286. In Figure 6.10(b), we see that the area between k and -0.18 is 0.4197, so the area to the left of k must be $0.4286 - 0.4197 = 0.0089$. Hence, from Table A.3, we have $k = -2.37$.

Sampling Distributions and Data Descriptions

CHAPTER 8

Random Sampling

In this chapter, we focus on **sampling** from **distributions** or **populations** and study such important quantities as the *sample mean and sample variance*.

A **population** consists of the totality of the observations with which we are concerned.

A **sample** is a subset of a population.

Let $X_1, X_2, \ldots, X_n$ be n independent random variables, each having the same probability distribution $f(x)$. Define $X_1, X_2, \ldots, X_n$ to be a **random sample** of size n from the population $f(x)$ and write its joint probability distribution as

$$f(x_1, x_2, \ldots, x_n) = f(x_1)f(x_2)\cdots f(x_n).$$

Some Important Statistics

Any function of the random variables constituting a random sample is called a **statistic**.

The two parameters μ *and* σ^2 *measure the center* of location and the variability of a probability distribution.

These are constant population parameters and are in no way affected or influenced by the observations of a random sample.

Location Measures of a Sample: The Sample Mean, Median, and Mode

Let $X_1, X_2, \ldots, X_n$ *represent* *n* *random variables.*

(a) Sample mean: $$\bar{X} = \frac{1}{n}\sum_{i=1}^{n} X_i$$

(b) Sample median: $$\tilde{x} = \begin{cases} x_{(n+1)/2}, & \text{if } n \text{ is odd,} \\ \frac{1}{2}(x_{n/2} + x_{n/2+1}), & \text{if } n \text{ is even.} \end{cases}$$

(c) The sample mode is the value of the sample that occurs most often.

Example 8.1

Suppose a data set consists of the following observations:

$$0.32\ 0.53\ 0.28\ 0.37\ 0.47\ 0.43\ 0.36\ 0.42\ 0.38\ 0.43.$$

(a) Sample mean: 3.99/10 = 0.399

(b) Sample median: (0.38+0.42)/2 = 0.4

(c) The sample mode: 0.43

0.28
0.32
0.36
0.37
0.38
0.42
0.43
0.43
0.47
0.53

Variability Measures of a Sample: The Sample Variance, Standard Deviation, and Range

(a) Sample variance:

$$S^2 = \frac{1}{n-1}\sum_{i=1}^{n}(X_i - \bar{X})^2$$

$$S^2 = \frac{1}{n(n-1)}\left[n\sum_{i=1}^{n}X_i^2 - \left(\sum_{i=1}^{n}X_i\right)^2\right]$$

(b) Sample standard deviation:

$$S = \sqrt{S^2},$$

(c) Sample range:

$$R = X_{\max} - X_{\min}$$

Example 8.3:

Find the variance of the data 3, 4, 5, 6, 6, and 7, representing the number of trout caught by a random sample of 6 fishermen on June 19, 1996, at Lake Muskoka.

***Solution*:** We find that $\sum_{i=1}^{6} x_i^2 = 171$, $\sum_{i=1}^{6} x_i = 31$, and $n = 6$. Hence,

$$s^2 = \frac{1}{(6)(5)}[(6)(171) - (31)^2] = \frac{13}{6}.$$

Thus, the sample standard deviation $s = \sqrt{13/6} = 1.47$ and the sample range is $7 - 3 = 4$.

Sampling Distributions

The probability distribution of a statistic is called a **sampling distribution**.

What Is the Sampling Distribution of $\bar{X}$?

Suppose that a random sample of ***n*** *observations is taken from a normal* population with mean ***μ*** *and variance* ***σ²***.

Each observation X_i *, i = 1, 2, . . . , n, of* the random sample will then have the same normal distribution as the population being sampled.

$$\bar{X} = \frac{1}{n}(X_1 + X_2 + \cdots + X_n)$$

has a normal distribution with mean and variance

$$\mu_{\bar{X}} = \frac{1}{n}(\underbrace{\mu + \mu + \cdots + \mu}_{n \text{ terms}}) = \mu$$

$$\sigma^2_{\bar{X}} = \frac{1}{n^2}(\underbrace{\sigma^2 + \sigma^2 + \cdots + \sigma^2}_{n \text{ terms}}) = \frac{\sigma^2}{n}$$

The sampling distribution of $\bar{X}$ *will still be approximately normal with*

mean *μ and variance* σ^2/n*, provided that the sample size is large.*

The Central Limit Theorem

Central Limit Theorem: If $\bar{X}$ is the mean of a random sample of size n taken from a population with mean μ and finite variance σ^2, then the limiting form of the distribution of

$$Z = \frac{\bar{X} - \mu}{\sigma / \sqrt{n}},$$

as $n \to \infty$, is the standard normal distribution $n(z; 0, 1)$.

Example 8.4:

An electrical firm manufactures light bulbs that have a length of life that is approximately normally distributed, with mean equal to 800 hours and a standard deviation of 40 hours. Find the probability that a random sample of 16 bulbs will have an average life of less than 775 hours.

***Solution*:** The sampling distribution of $\bar{X}$ will be approximately normal, with $\mu_{\bar{X}} = 800$ and $\sigma_{\bar{X}} = 40/\sqrt{16} = 10$. The desired probability is given by the area of the shaded region in Figure 8.2.

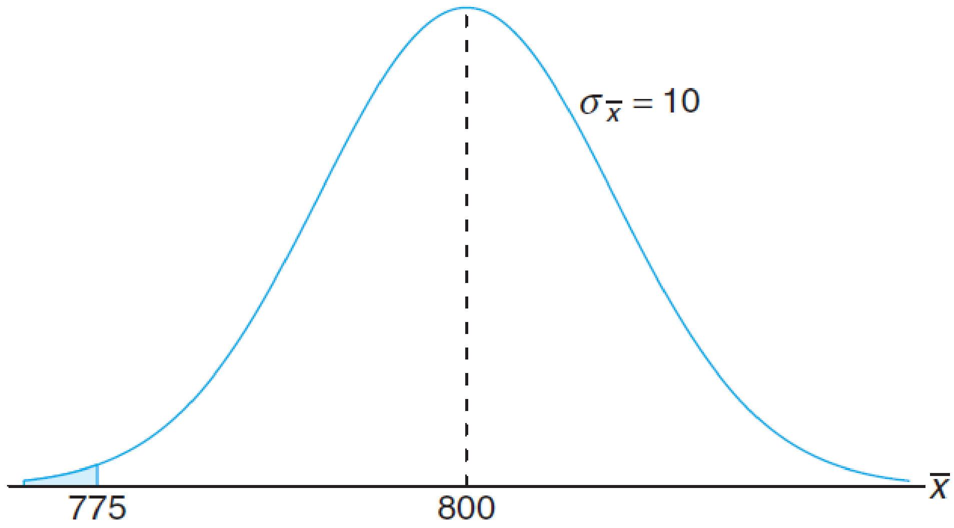


Figure 8.2: Area for Example 8.4.

Corresponding to $\bar{x} = 775$, we find that

$$z = \frac{775 - 800}{10} = -2.5,$$

and therefore

$$P(\bar{X} < 775) = P(Z < -2.5) = 0.0062.$$

Example 8.5:

Traveling between two campuses of a university in a city via shuttle bus takes, on average, 28 minutes with a standard deviation of 5 minutes. In a given week, a bus transported passengers 40 times. What is the probability that the average transport time was more than 30 minutes? Assume the mean time is measured to the nearest minute.

Solution: In this case, $\mu = 28$ and $\sigma = 3$. We need to calculate the probability $P(\bar{X} > 30)$ with $n = 40$. Since the time is measured on a continuous scale to the nearest minute, an $\bar{x}$ greater than 30 is equivalent to $\bar{x} \geq 30.5$. Hence,

$$P(\bar{X} > 30) = P\left(\frac{\bar{X} - 28}{5/\sqrt{40}} \geq \frac{30.5 - 28}{5/\sqrt{40}}\right) = P(Z \geq 3.16) = 0.0008.$$

There is only a slight chance that the average time of one bus trip will exceed 30 minutes. An illustrative graph is shown in Figure 8.4.
