

Internet of Things

MQTT for IoT Messaging

IoT Team, BFC AI

MQTT: Informal Introduction

- An admin (**publisher**) can **publish** a new post (**topic**) on a Facebook page.
- Facebook (**broker**) will send that **topic** to **subscribers** who liked the page.

MQTT: Formal Introduction

- MQTT stands for **Message Queuing Telemetry Transport**.
- It is a **messaging protocol** designed for easy implementation.
- It is a **lightweight communication protocol** with minimal packet overhead.
- It is generally used for **communication between IoT devices**.
- MQTT is **designed especially** for the **Internet of things (IoT)**.
- MQTT is more and more becoming the **standard messaging protocol** for **IoT messaging**.
- MQTT was developed by **IBM** in **1999**.
- MQTT is a **publish/subscribe protocol**.

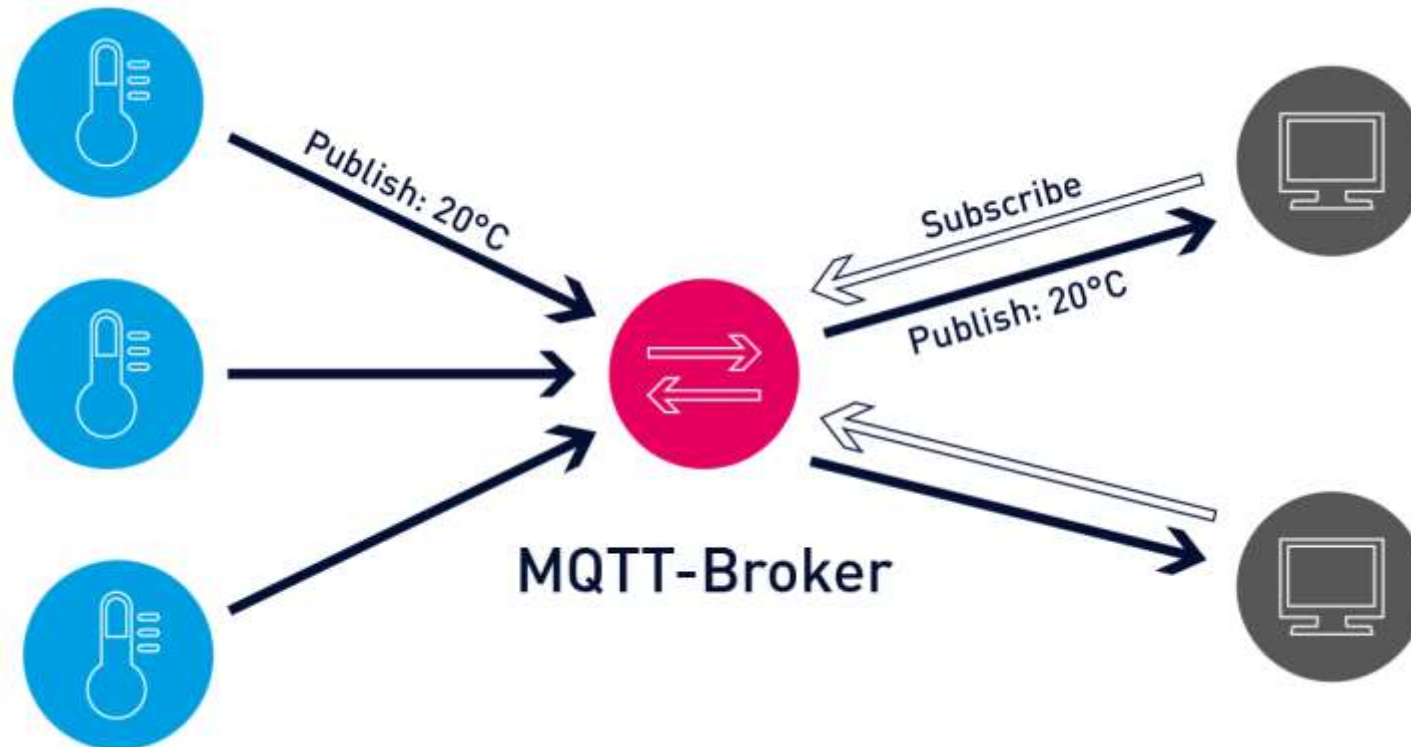

MQTT: Broker

- In MQTT, the clients (such as sensors, machines, and applications) **do not directly communicate with each other** but via a **broker**.
- Broker is a **intermediary device** connects various **publishers** and subscribers by **managing and routing the data**.

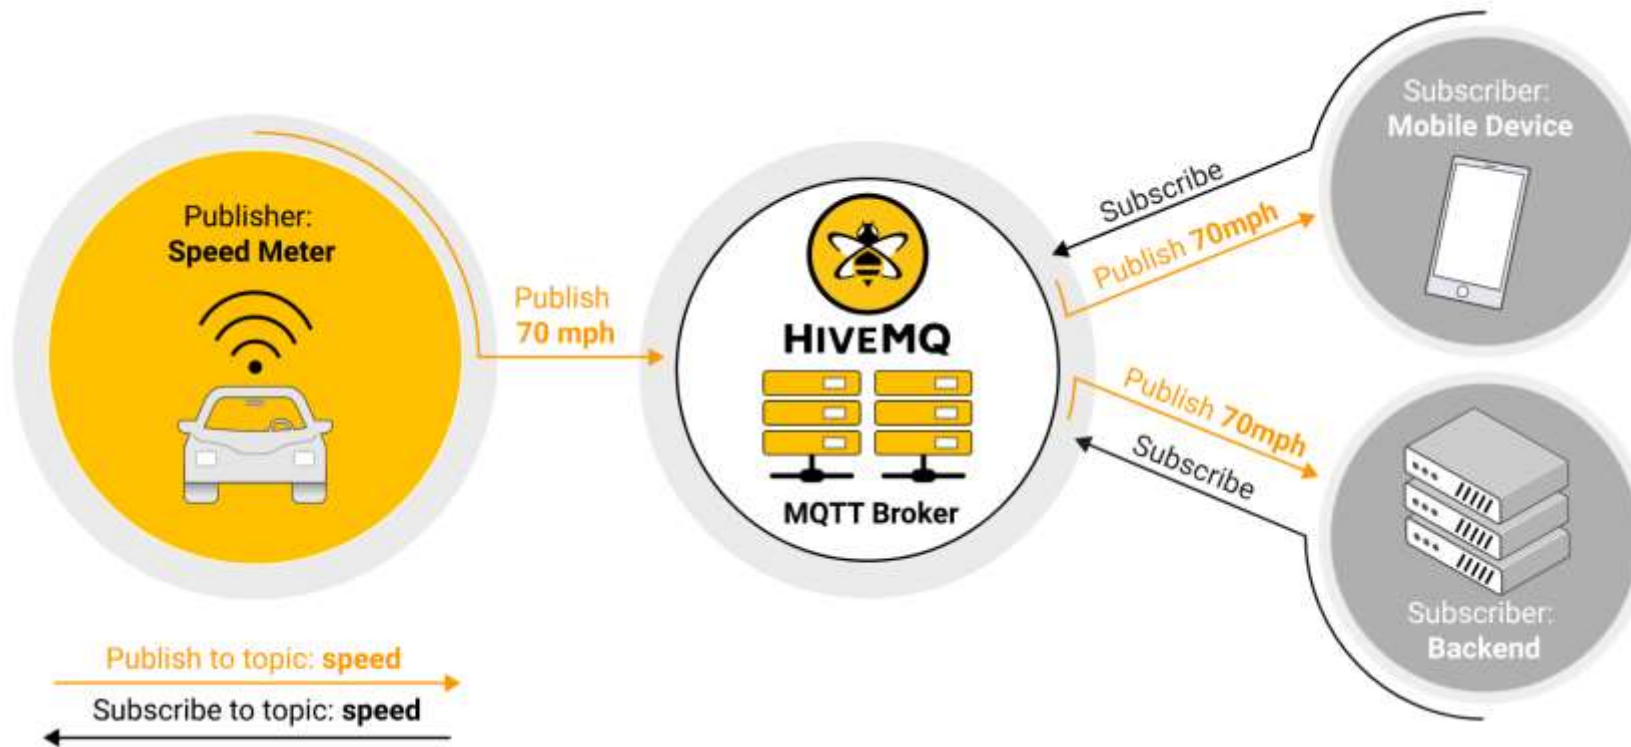

MQTT: Broker

- And just as functioning of the heart is critical for the human body, a reliable and performant **MQTT broker is critical for IoT operations**.
- The **MQTT broker** receives the data from the senders, filters the data packets, and forwards them to the receiving clients.

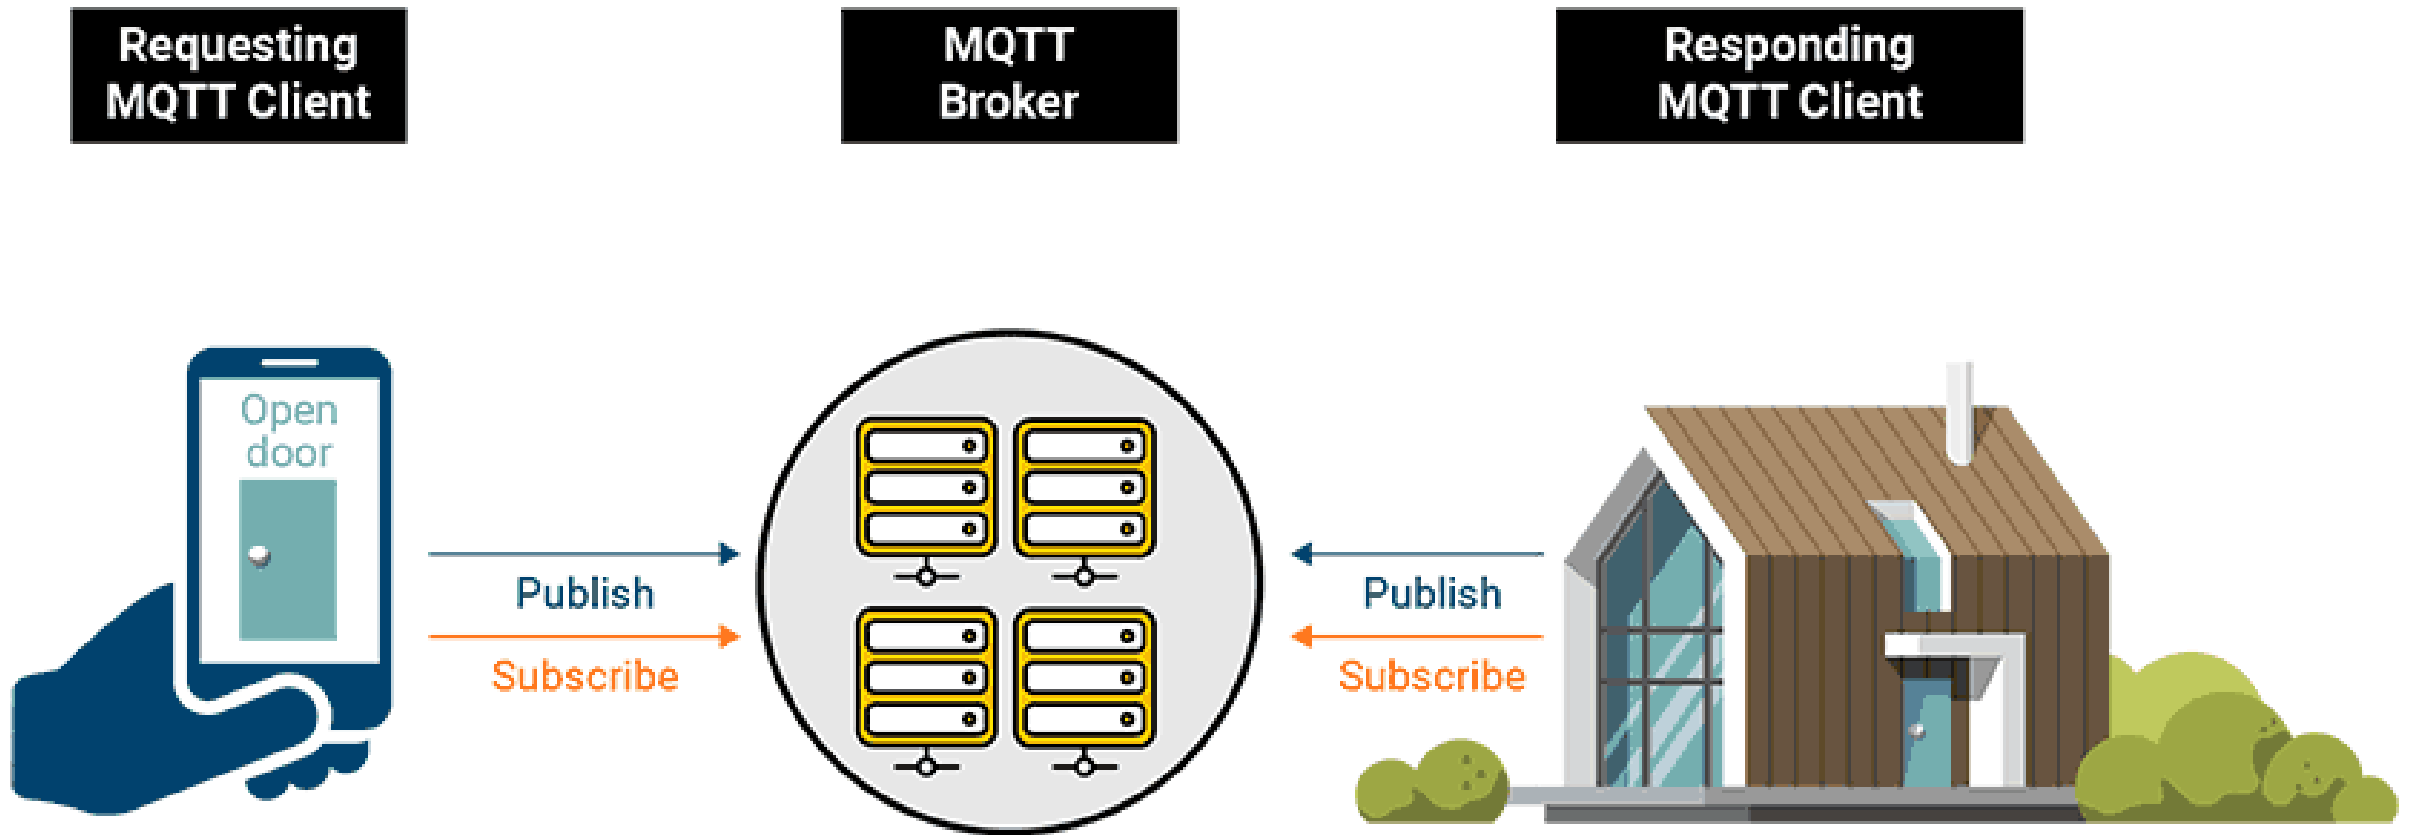

MQTT: Publishers & Subscribers

- Clients sending data are called **publishers**.
- Clients who receive data are called **subscribers**.
- In a publish and subscribe system, a device can **publish a message** on a topic, or it can be **subscribed to a particular topic** to receive messages

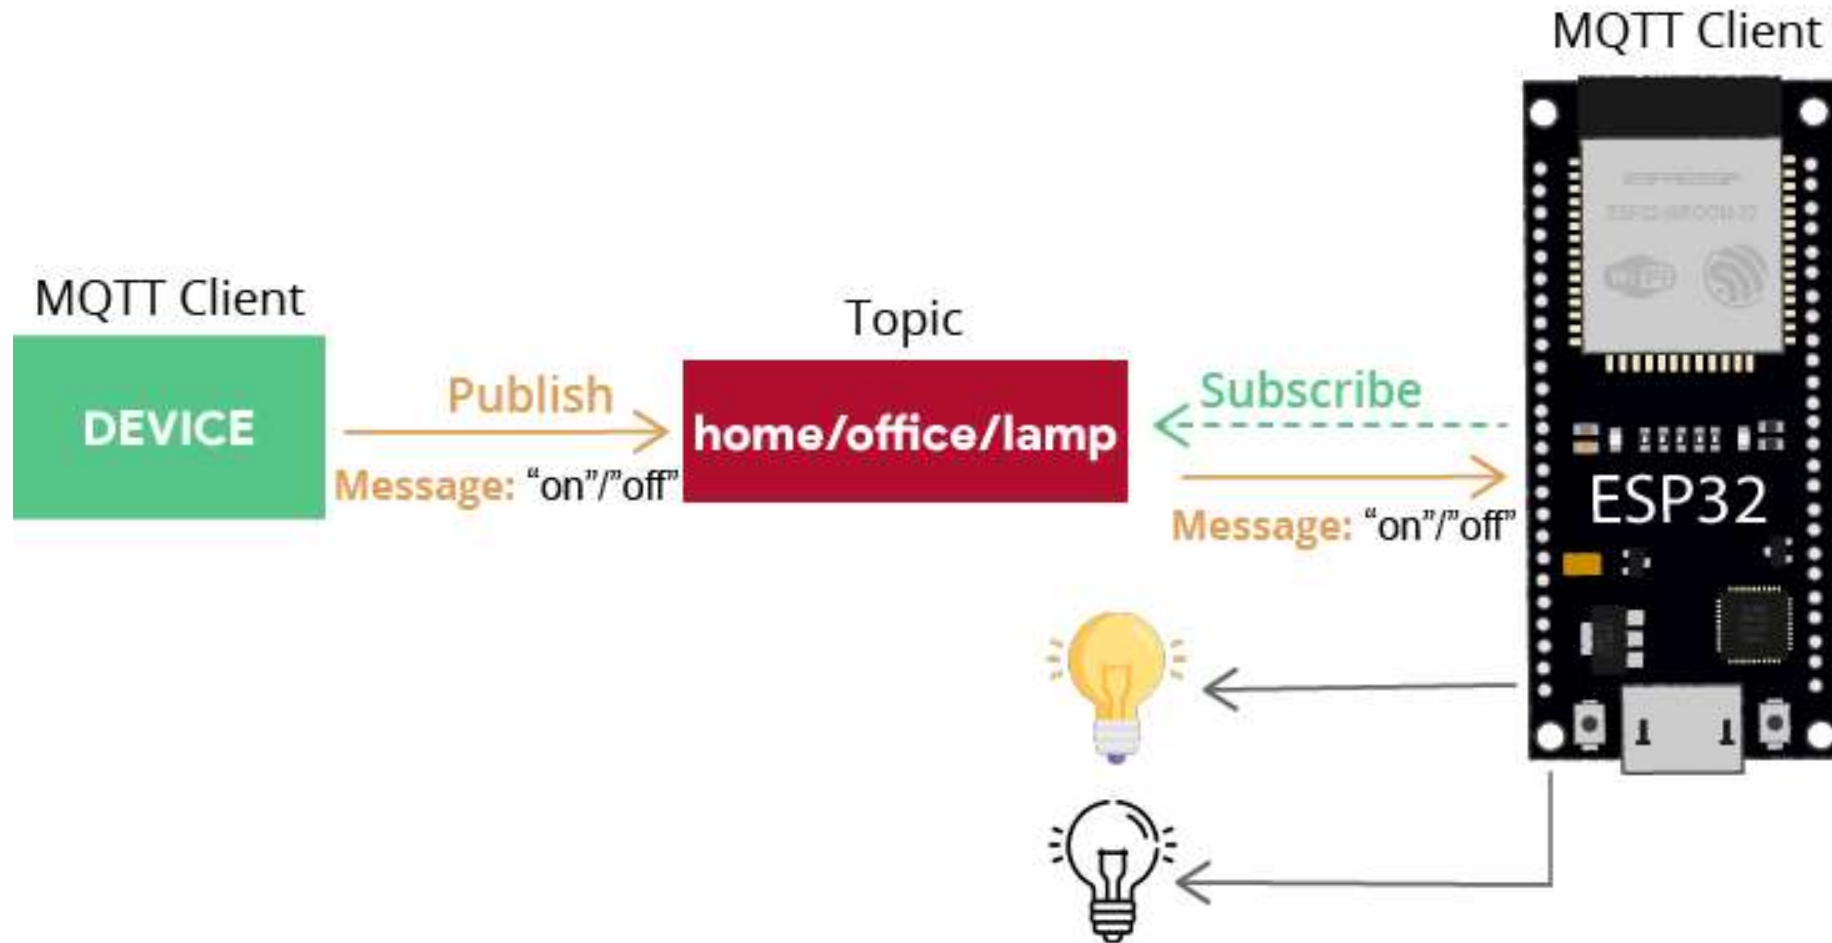

MQTT: Publishers & Subscribers

- An MQTT system enables receiving clients to **become publishers** as well.

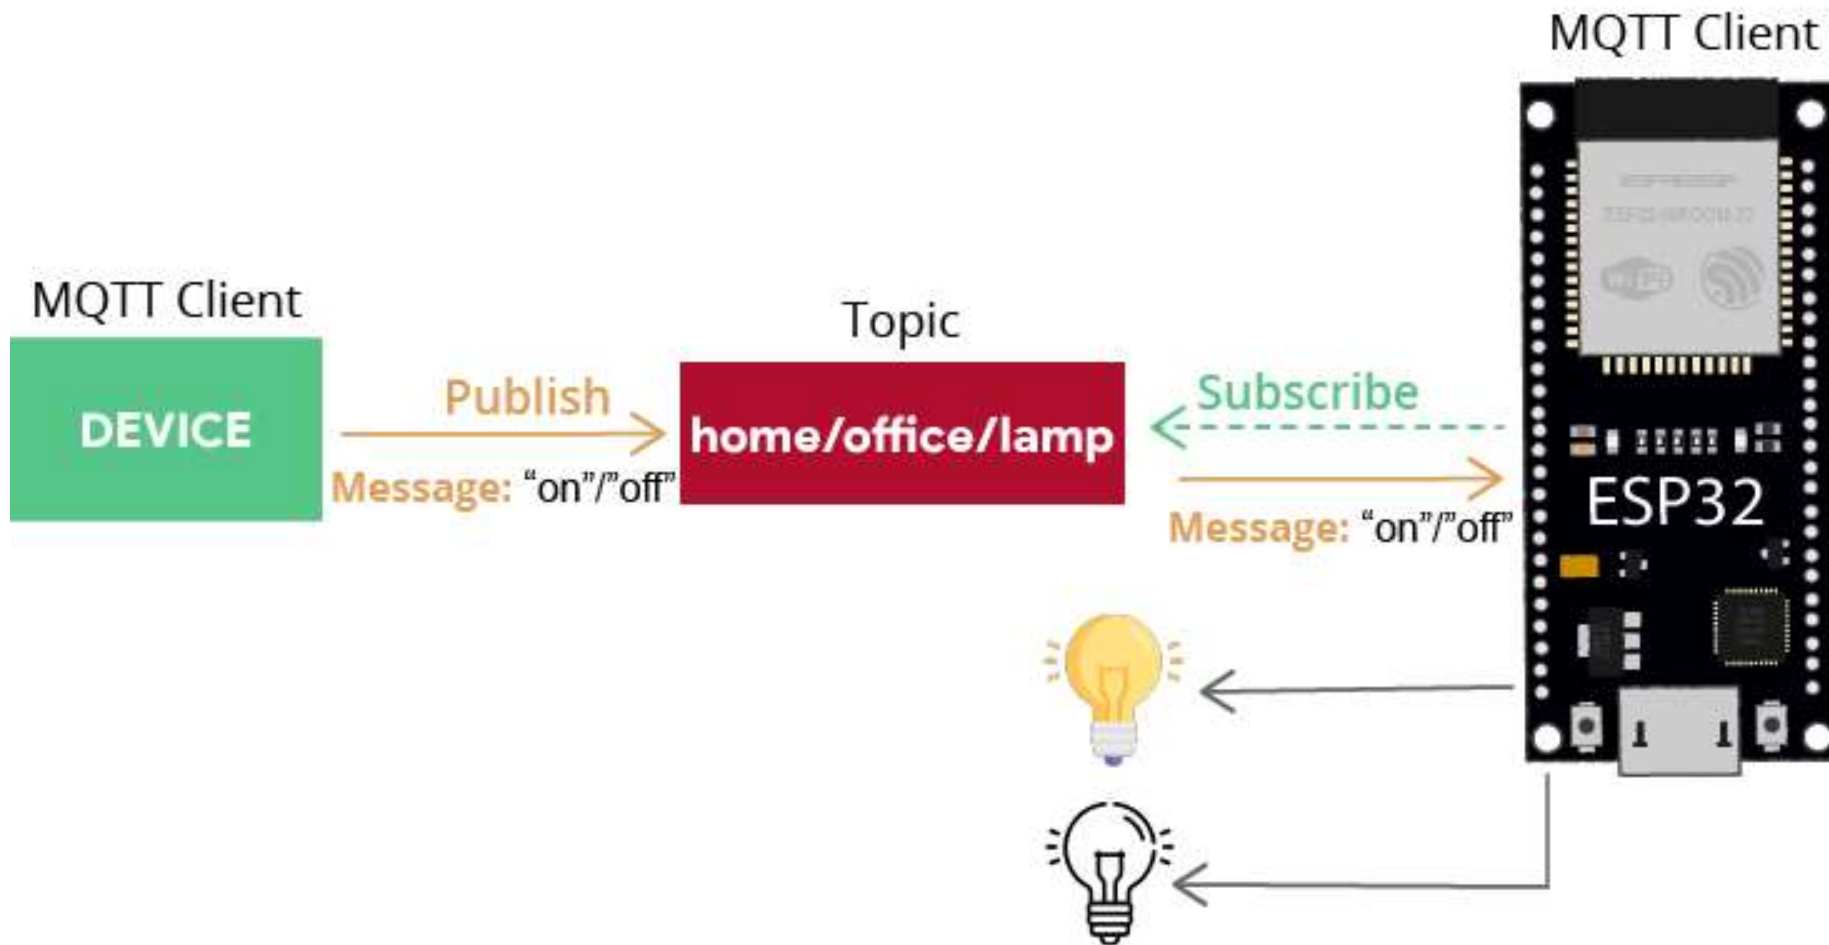

MQTT: Messages

- Messages are the **data that you want to exchange** between your devices.
- For example, a **message** can be a **command** or data like **sensor readings**.

MQTT: Topics

- A **topic** is the way you register interest for incoming messages or how you specify where you want to publish the message.

MQTT: Functionality

- First, the **publisher** sends the **data collected** to the **broker** on a particular **topic**, which is similar to a channel for data transmission.
- Please note that a **topic** can have **several subtopics** too.
- For example, in an application where you **send the temperature** data from a sensor connected to your **fridge**, the topic will look something like this:

Kitchen/Fridge
- The **main topic** is the **kitchen**, and the **Fridge** is the **subtopic**.
- The **message** will be **Temperature:14** on the given topic.

MQTT: Functionality

- The **subscribers** listen to the topic.
- So, if the **subscriber** is listening to the **Kitchen** topic, it will have **access to all the subtopics** that are a part of this topic.

Kitchen/Fridge

- The **primary function** of the **broker** is to **manage all the available topics** and **route the information** according to the type of client, namely **publishers** and **subscribers**.
- Note that both the **publishers** and **subscribers** are referred to as **clients**.
- A **client** can be a **publisher**, **subscriber**, or **both**.

MQTT: Air Quality Monitoring System

- **Publishers:** Devices or machines are responsible for sending the collected data to the brokers.

If you have an air quality monitoring system that monitors the CO₂ levels in the air every 30 seconds, the device will be set to publish the CO₂ concentration values every 30 seconds.

- **Subscribers:** Devices receive the requested sensor data from the brokers.

An air purifier can be a subscriber of our air quality monitoring system.

It receives the CO₂ concentration values every 30 seconds, and when it crosses a threshold value, the purifier automatically turns on.

- **Broker:** This intermediary device connects various publishers and subscribers by managing and routing the data.

Lightweight and Efficient

- MQTT clients are tiny, and they **require minimal resources** to operate.
- So, even microcontrollers such as **ESP8266** can be used as a client **as long as they have an active connection to a network.**

Bidirectional Communication Protocol

- This means a device can be a **publisher** and a **subscriber** **at the same time.**
- This also allows **easy broadcasting of messages** to **several devices at once.**

Highly Secure

- MQTT makes it **easy to encrypt messages**.
- The **standard unsecured port** is **1883**.
- The default **secured MQTT broker port** is **8883**.
- The use of **ACLs (Access Control Lists)** allows **restriction of subscriptions and publishing** of clients.

Highly Scalable

- There is **no worry** about maintaining clients' addresses or IDs.
- It is effortless to **expand the MQTT network**.
- The only things required are the **broker's IP address** and the **topic name**.

Reliability

- MQTT is **highly reliable** when it comes to **message delivery**.
- MQTT comes with **three** predefined **quality of service**:
 - QoS 0**: At most once
 - QoS 1**: At least once
 - QoS 2**: Exactly once

MQTT: Quality of Service (QoS)

- MQTT provides **three Quality of Service (QoS) levels** for individual message delivery.
- MQTT QoS is an **agreement** between the message **sender** and **receiver** that defines the **level of delivery guarantee for a specific message**.

QoS Level	Meaning	# Messages Delivered
Level 0	The message will be delivered at most once , but maybe not at all .	0 or 1
Level 1	The message will be delivered at least once , but perhaps more .	1 or more
Level 2	The message will be delivered exactly once .	1

MQTT: QoS Level 0

- In QoS Level 0 (Fire and Forget Level), messages are **sent without any confirmation from the receiver.**
- This means it is technically possible for a **message to get lost**, given an **unreliable connection.**

MQTT: QoS Level 1

- In QoS Level 1, the **receiver must send a confirmation (PUBACK)** to let the sender know that the message was received.
- However, it is possible that the receiver gets a message multiple times.
- This QoS level **ensures that a message makes it from sender to receiver** but does not ensure that it is received exactly once.

MQTT: QoS Level 2

- QoS level 2 uses a four-step communication process to **ensure a message is sent exactly once only**.
- QoS 2 offers the **highest level of service** in MQTT, **ensuring that each message is delivered exactly once** to the intended receiver.
- It involves a **four-step handshake** between the **sender** and **receiver**.

MQTT: QoS Level 2 – Explanation

- When a receiver gets a QoS 2 PUBLISH packet from a sender, it **replies to the sender with** a **PUBREC** packet that acknowledges the publisher.
- If the sender **does not get** a **PUBREC** packet from receiver, it **sends the packet again** with a **duplicate flag** until it receives an **acknowledgement**.

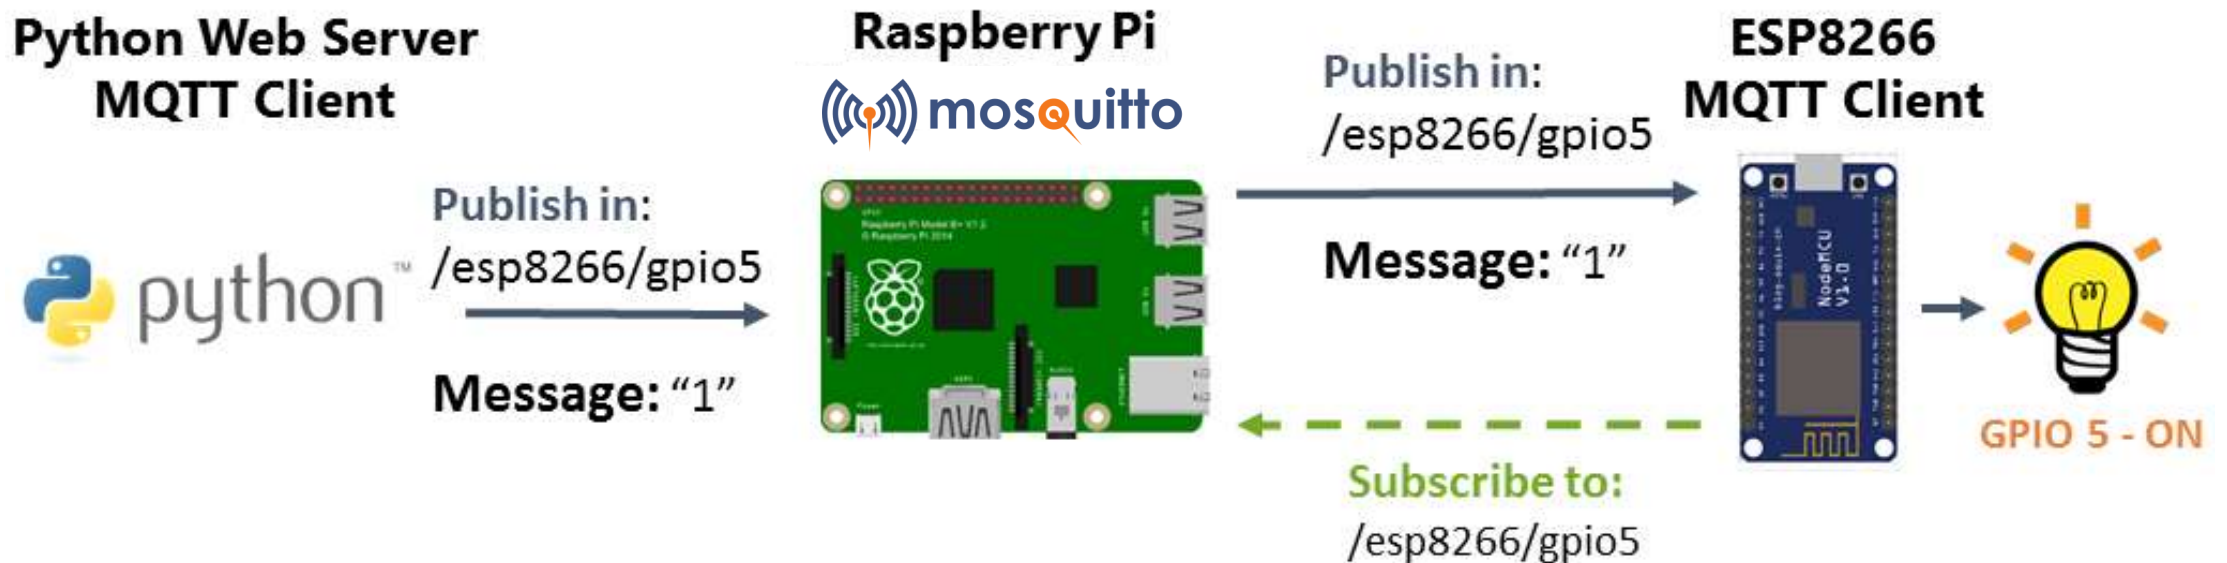

Mosquitto Broker

- Mosquitto is a popular and open-source message broker that implements the MQTT protocol.
- Mosquitto is lightweight and is suitable for use on all devices from low power single board computers to full servers.
- The broker receives all messages from the clients, filters the messages, determines who is subscribed to the topic, and then sends the message to these subscribed clients.

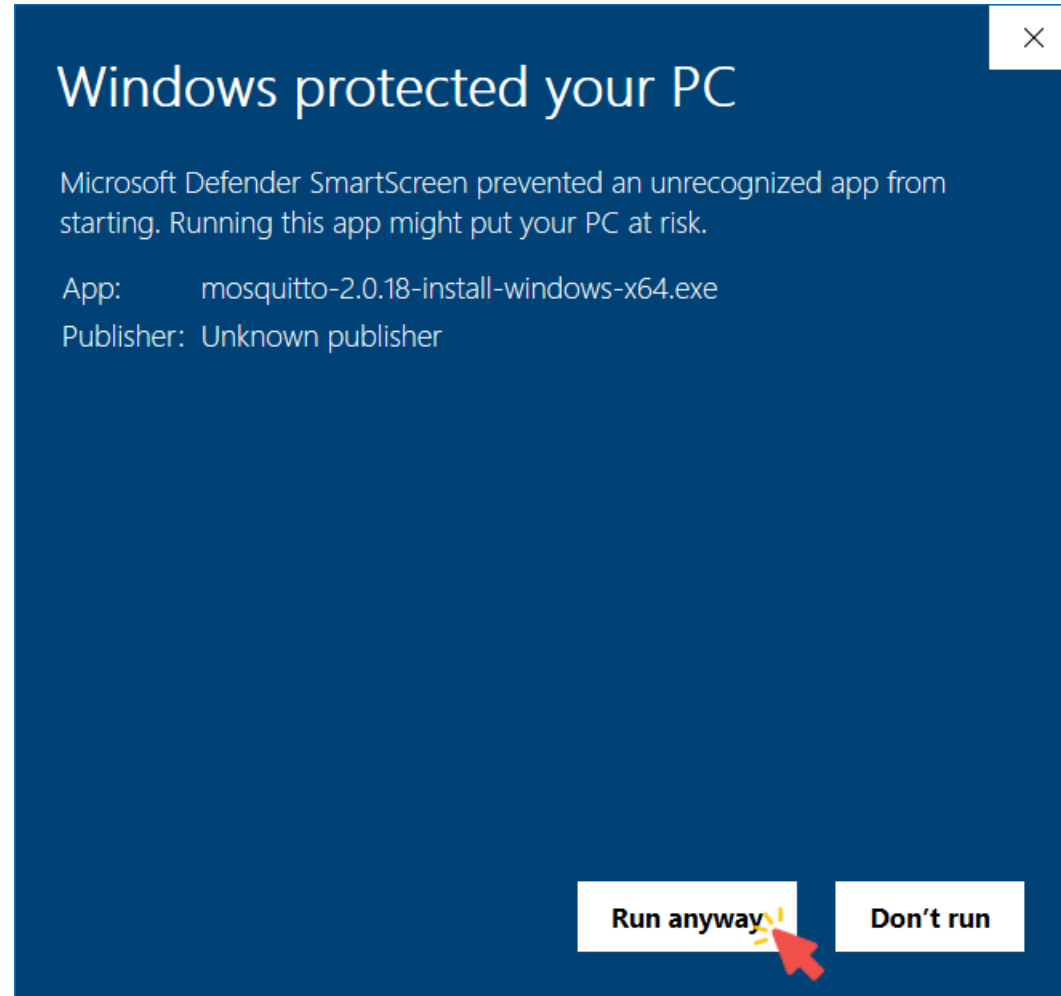

Mosquitto Broker

- In the world of IoT, where devices need to communicate efficiently, **Mosquitto's** ability to handle multiple connections and **deliver messages in real-time** is very useful.
- Mosquitto MQTT can run on **various operating systems**, including **Linux**, **Windows**, **macOS**, and even on **Raspberry Pi**.

Mosquitto Broker: Installation on Windows

- If this message appears, click “**Run anyway**”.

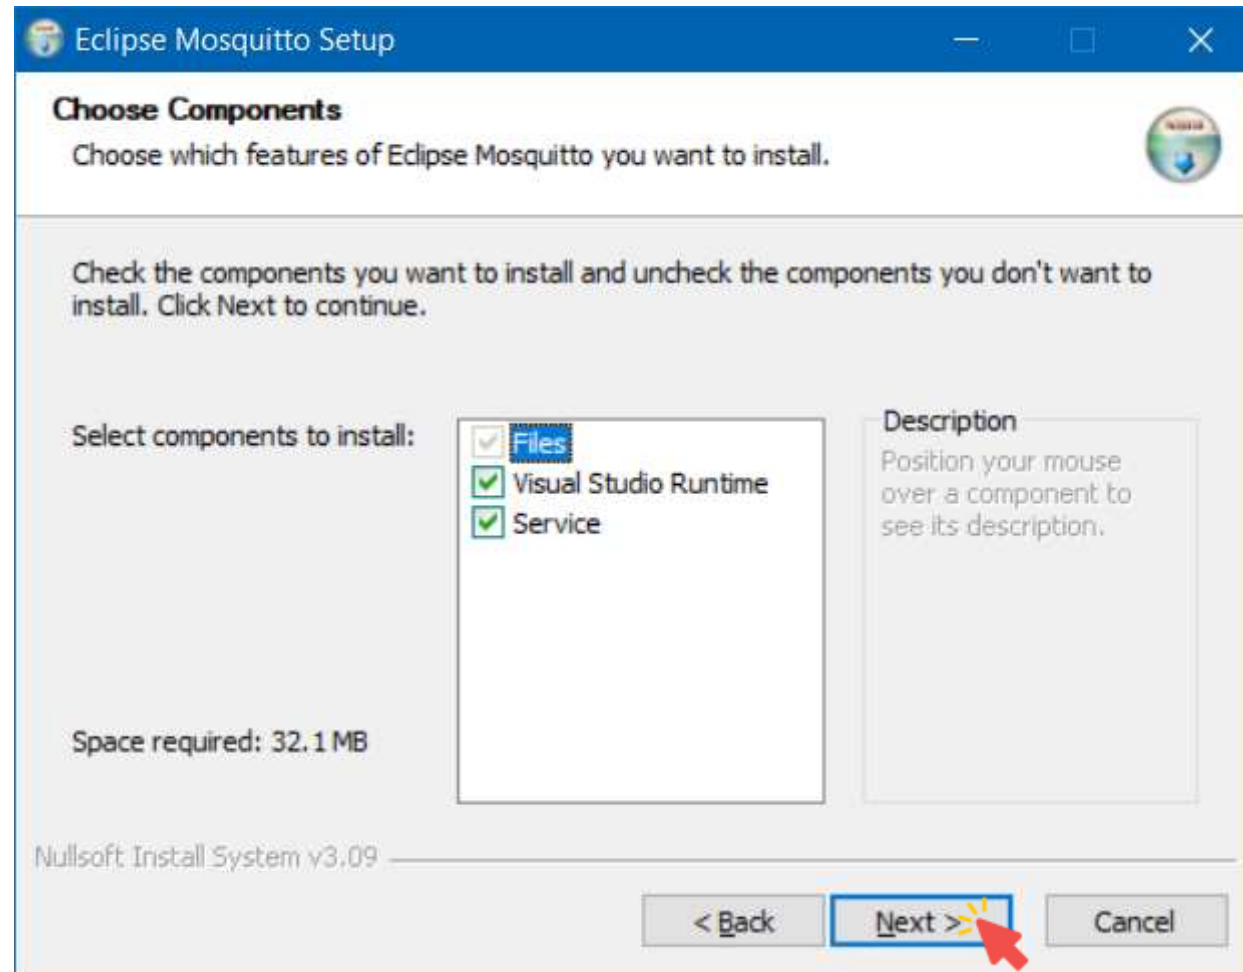

Mosquitto Broker: Installation on Windows

- Click **Next**.

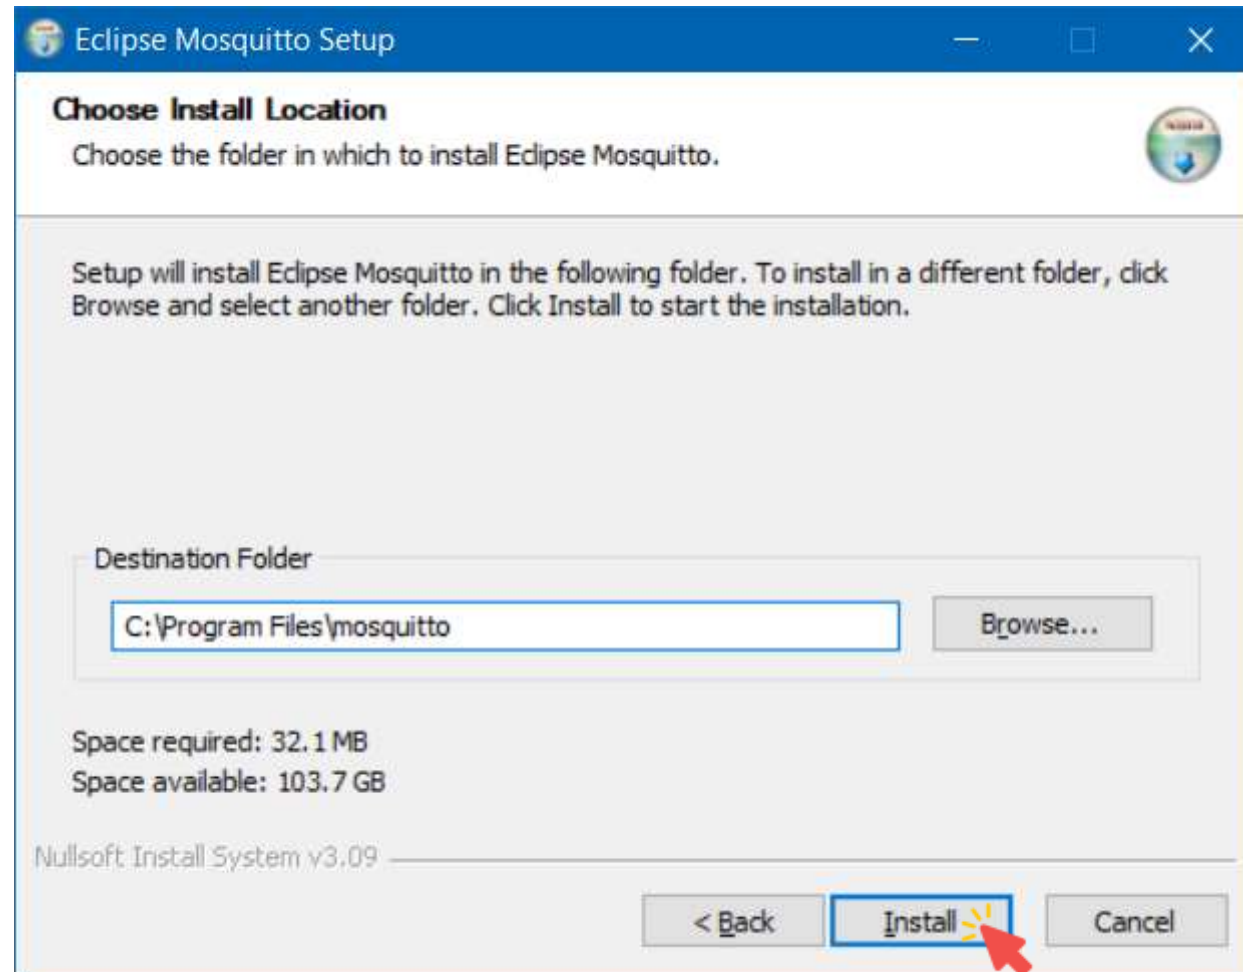

Mosquitto Broker: Installation on Windows

- Click **Next**.

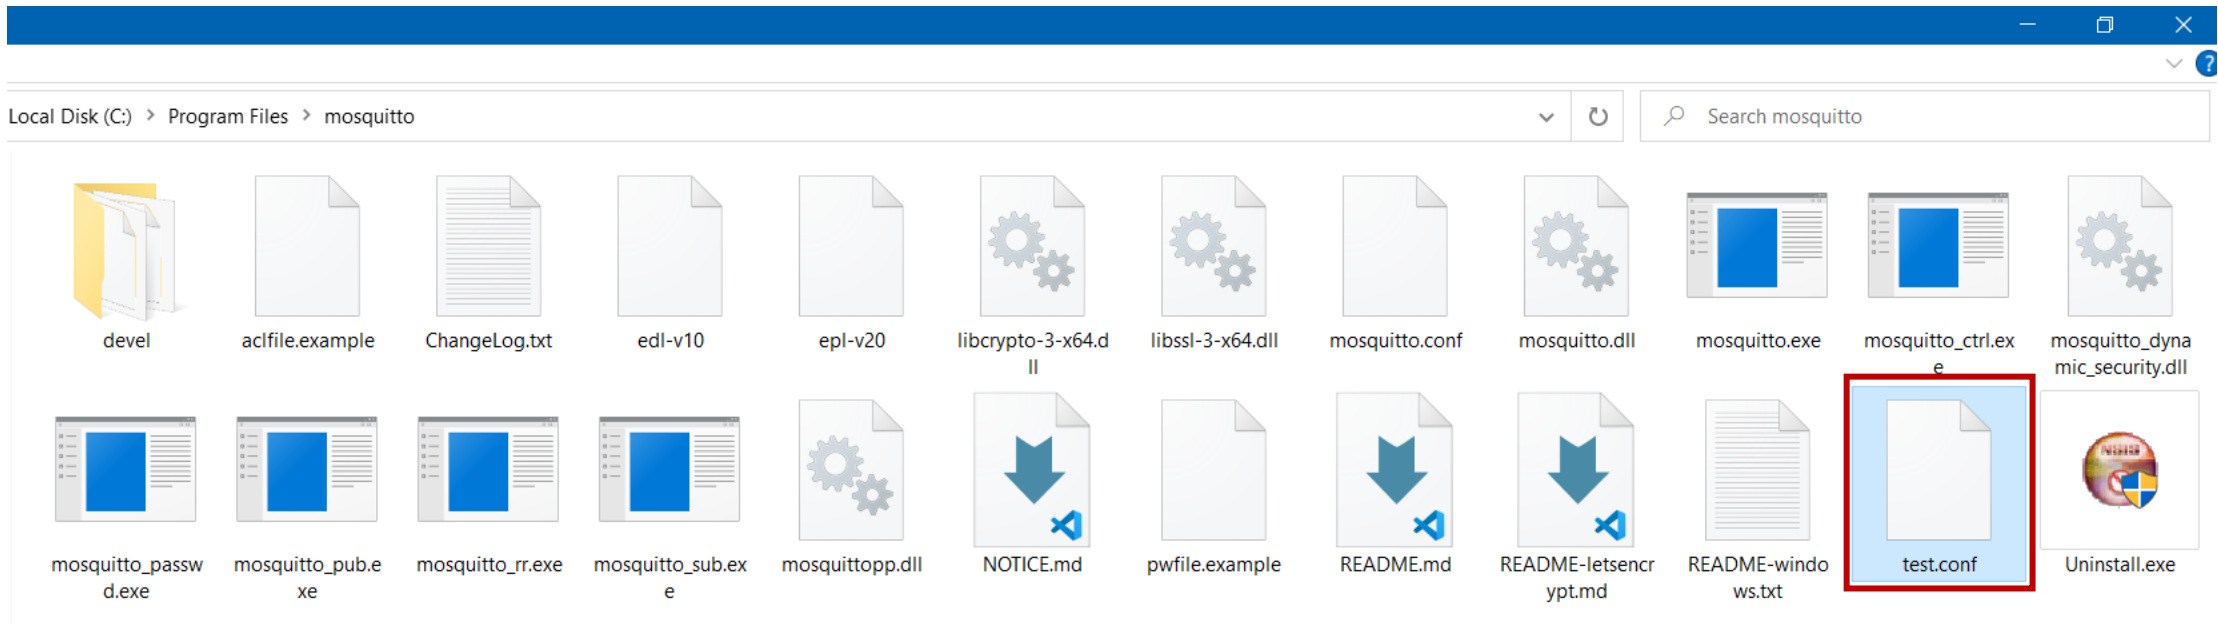

Mosquitto Broker: Installation on Windows

- Choose the installation path, and click **Install**.

Mosquitto Broker: Unauthenticated Access Configurations

- Create a text file named **test.conf** under the Mosquitto folder (C:\Program Files\mosquitto).

Mosquitto Broker: Unauthenticated Access Configurations

- Open the created file, and write the following commands:

```
listener 1883
```

```
allow_anonymous true
```

```
test.conf - Notepad
File Edit Format View Help
listener 1883
allow_anonymous true
```

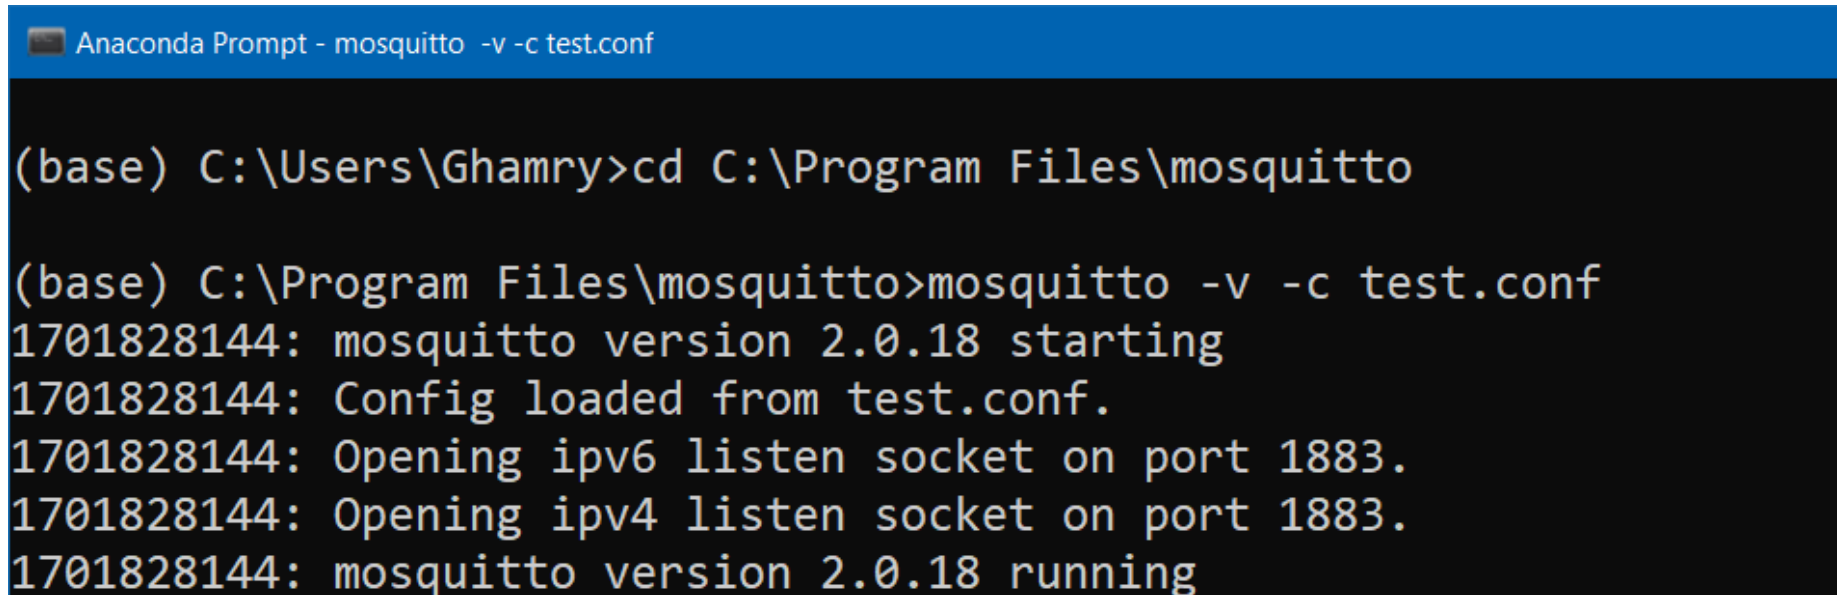

- MQTT clients typically connect to the broker on **port 1883**, which is the default port for unencrypted MQTT communication.
- When **allow_anonymous** is set to **true**, clients can connect without providing a username or password.

Mosquitto Broker: Starting the Broker

- Open **CMD** window and write the following commands:

```
cd C:\Program Files\mosquitto
```

```
mosquitto -c test.conf -v
```

```
Anaconda Prompt - mosquitto -v -c test.conf

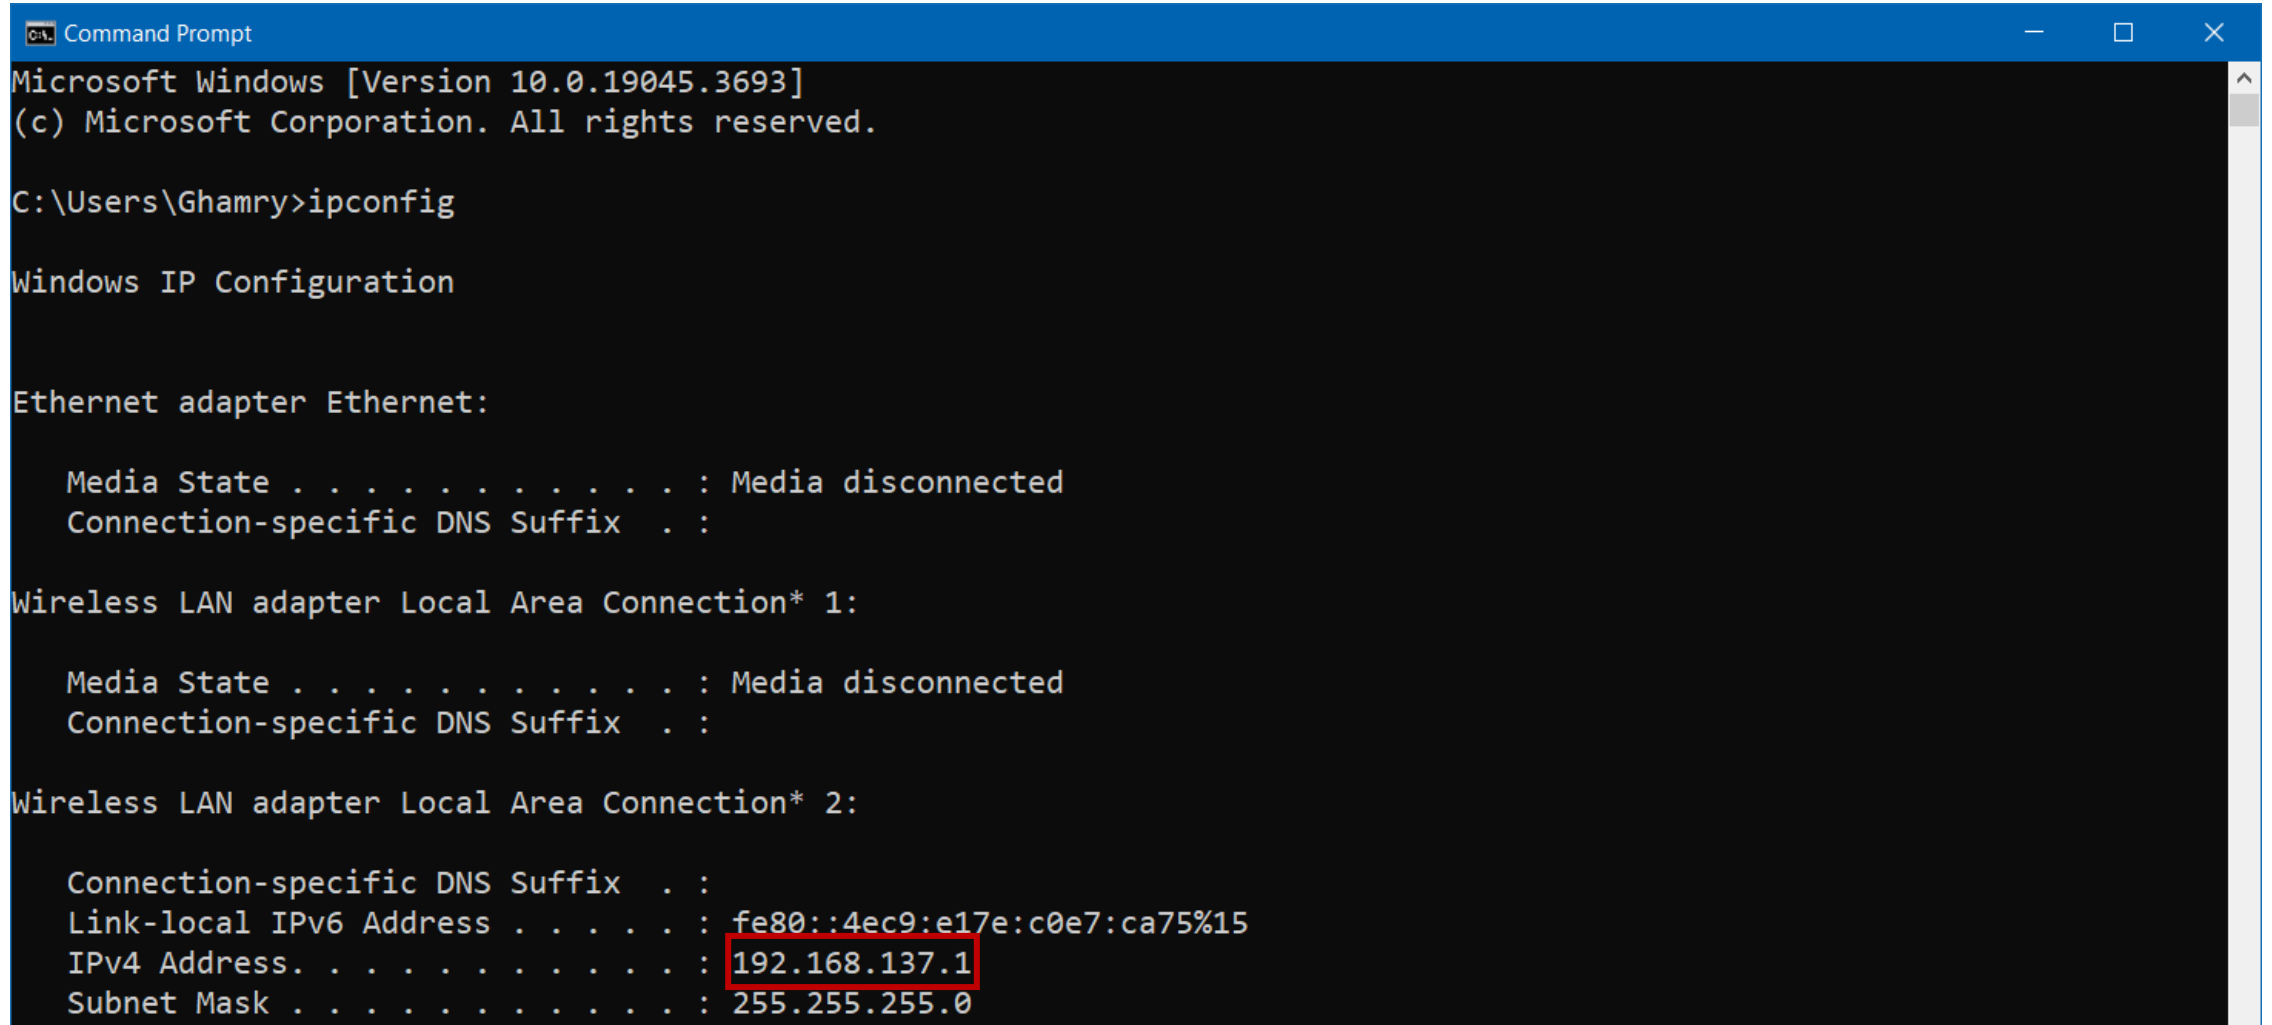

(base) C:\Users\Ghamry>cd C:\Program Files\mosquitto

(base) C:\Program Files\mosquitto>mosquitto -v -c test.conf
1701828144: mosquitto version 2.0.18 starting
1701828144: Config loaded from test.conf.
1701828144: Opening ipv6 listen socket on port 1883.
1701828144: Opening ipv4 listen socket on port 1883.
1701828144: mosquitto version 2.0.18 running
```

- **-c test.conf**: Specifies a **configuration file** for the Mosquitto broker.
- **-v**: Enables **verbose mode** to provide **additional information** and **logging**.

Mosquitto Broker: Getting Broker IP

- Open **CMD** window and write **ipconfig** to get the broker IP.

```
Command Prompt
Microsoft Windows [Version 10.0.19045.3693]
(c) Microsoft Corporation. All rights reserved.

C:\Users\Ghamry>ipconfig

Paho MQTT Python Library

- The **Paho Python Client** provides a client class with **support for MQTT**.
- It provides a **simple API** for working with MQTT, allowing developers to **easily integrate MQTT functionality into their Python applications**.
- “**Paho**” means “**communicate with everyone**”.
- You can install the Paho Python Client using the following **pip** command:

```
pip install paho-mqtt==1.6.1
```

```
Anaconda Prompt
(base) C:\Users\Ghamry>pip install paho-mqtt==1.6.1

**Python App
(Subscriber)**

NodeMCU as Publisher: Code

```
#include <ESP8266WiFi.h> // Include the WiFi library
#include <PubSubClient.h> // Include the MQTT library

const char* ssid = "iotlab"; // WiFi SSID
const char* password = "hostiotlab"; // WiFi Password

const char* broker = "192.168.137.1"; // MQTT broker address
const int port = 1883; // MQTT broker port
const char* topic = "home/led"; // MQTT topic name

WiFiClient espClient; // Create an object of the WiFiClient class
PubSubClient client(espClient); // Create an MQTT client instance

void setup() {
  Serial.begin(115200); // Initialize serial communication at baudrate of 115200

  WiFi.begin(ssid, password); // Attempt to connect to the Wi-Fi network
  while (WiFi.status() != WL_CONNECTED) { // Wait until the NodeMCU is successfully connected
    delay(1000); // Wait 1 second before rechecking Wi-Fi connection status
    Serial.println("Connecting to WiFi..."); // A message indicating an attempt to connect to Wi-Fi
  } // A message indicating a successful connection
  Serial.println("Connected to WiFi.");

  client.setServer(broker, port); // Connect to the MQTT broker
  client.connect("NodeMCU_Publisher"); // Connect to MQTT broker with the name "NodeMCU_Publisher"
  Serial.println("Connected to MQTT broker."); // Successful connection to MQTT broker
}

void loop() {
  const char* message = "Turn On"; // The message to be published
  client.publish(topic, message); // Publish the message to the specified topic
  Serial.print("Published message: "); // A message prefix
  Serial.println(message); // Print the published message

  delay(1000); // Short delay to avoid rapid publishing
}
```

NodeMCU as Publisher: NodeMCU Output

The image shows a serial terminal window titled "COM10". The window contains the following text output from a NodeMCU device:

```
Connecting to WiFi...  
Connecting to WiFi...  
Connecting to WiFi...  
Connecting to WiFi...  
Connecting to WiFi...  
Connected to WiFi.  
Connected to MQTT broker.  
Published message: Turn On  
Published message: Turn On  
Published message: Turn On  
Published message: Turn On
```

The terminal window includes a "Send" button at the top right and a status bar at the bottom with the following options: Autoscroll, Show timestamp, Both NL & CR (dropdown), 115200 baud (dropdown), and Clear output.

NodeMCU as Subscriber
