## Introduction

A logic circuit is composed of:

- Inputs
- Outputs
- Functional specification
- Timing specification

## Circuits

- Nodes
- Inputs: $A, B, C$
- Outputs: $Y, Z$
- Internal: n1
- Circuit elements
- E1, E2, E3
- Each a circuit

## Types of Logic Circuits

- Combinational Logic
- Memoryless
- Outputs determined by current values of inputs
- Sequential Logic
- Has memory
- Outputs determined by previous and current values of inputs

## Rules of Combinational Composition

- Every element is combinational
- Every node is either an input or connects to exactly one output
- The circuit contains no cyclic paths
- Example:

## Boolean Equations

- Functional specification of outputs in terms of inputs
- Example: $S=F\left(A, B, C_{\text {in }}\right)$

$$
C_{\text {out }}=F\left(A, B, C_{\text {in }}\right)
$$

$$
\begin{aligned}
& S=A \oplus B \oplus C_{\mathrm{in}} \\
& C_{\mathrm{out}}=A B+A C_{\mathrm{in}}+B C_{\mathrm{in}}
\end{aligned}
$$

## Some Definitions

- Complement: variable with a bar over it $\bar{A}, \bar{B}, \bar{C}$
- Literal: variable or its complement $A, \bar{A}, B, \bar{B}, C, \bar{C}$
- Implicant: product of literals
$A B C, A C, B C$
- Minterm: product that includes all input variables $A B \bar{C}, A \bar{B} \bar{C}, A B C$
- Maxterm: sum that includes all input variables
$(A+\bar{B}+C),(\bar{A}+B+\bar{C}),(\bar{A}+\bar{B}+C)$

## Sum-of-Products (SOP) Form

- All equations can be written in SOP form
- Each row has a minterm
- A minterm is a product (AND) of literals
- Each minterm is TRUE for that row (and only that row)
- Form function by ORing minterms where the output is TRUE
- Thus, a sum (OR) of products (AND terms)

| $\boldsymbol{A}$ | $\boldsymbol{B}$ | $\boldsymbol{Y}$ | minterm | minterm <br> name |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | $\overline{\mathrm{~A}} \overline{\mathrm{~B}}$ | $m_{0}$ |
| 0 | 1 | 1 | $\overline{\mathrm{~A}} \mathrm{~B}$ | $m_{1}$ |
| 1 | 0 | 0 | $\mathrm{~A} \overline{\mathrm{~B}}$ | $m_{2}$ |
| 1 | 1 | 1 | A B | $m_{3}$ |

$$
Y=\mathbf{F}(A, B)=\bar{A} B+A B=\Sigma(1,3)
$$

## Product-of-Sums (POS) Form

- All Boolean equations can be written in POS form
- Each row has a maxterm
- A maxterm is a sum (OR) of literals
- Each maxterm is FALSE for that row (and only that row)
- Form function by ANDing the maxterms for which the output is FALSE
- Thus, a product (AND) of sums (OR terms)

| A | B | $\boldsymbol{Y}$ | maxterm | maxterm name |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | $A+B$ | M |
| 0 | 1 | 1 | $A+\bar{B}$ | $M_{1}$ |
| (1) | 0 | 0 | $\overline{\mathrm{A}}+\mathrm{B}$ | $M_{2}$ |
| 1 | 1 | 1 | $\overline{\mathrm{A}}+\overline{\mathrm{B}}$ | $M_{3}$ |

## Boolean Algebra

- Axioms and theorems to simplify Boolean equations
- Like regular algebra, but simpler: variables have only two values (1 or 0)
- Duality in axioms and theorems:
- ANDs and ORs, 0's and 1's interchanged

## T1: Identity Theorem

- $\mathrm{B} \cdot 1=\mathrm{B}$
- $\mathrm{B}+0=\mathrm{B}$

## T2: Null Element Theorem

- $\mathrm{B} \cdot 0=0$
- $\mathrm{B}+1=1$

## T3: Idempotency Theorem

## Simplifying Boolean Equations

## Example 1:

$$
\begin{aligned}
Y= & A B+\bar{A} B & & \\
& =B(A+\bar{A}) & & \mathrm{T} 8 \\
& =B(1) & & \mathrm{T} 5^{\prime} \\
& =B & & \mathrm{~T} 1
\end{aligned}
$$

## Simplifying Boolean Equations

## Example 2:

$$
\begin{aligned}
Y= & A(A B+A B C) \\
& =A(A B(1+C)) \\
& =A(A B(1)) \\
& =A(A B) \\
& =(A A) B \\
& =A B
\end{aligned}
$$

## DeMorgan's Theorem

$$
\text { - } Y=\overline{A B}=\bar{A}+\bar{B}
$$

- $Y=A+B=A \cdot B$

## Bubble Pushing

- Backward:
- Body changes
- Adds bubbles to inputs

- Forward:
- Body changes
- Adds bubble to output

## Bubble Pushing

- What is the Boolean expression for this circuit?

## Bubble Pushing Rules

- Begin at output, then work toward inputs
- Push bubbles on final output back
- Draw gates in a form so bubbles cancel

## Bubble Pushing Example

bubble on

no bubble on

## From Logic to Gates

- Two-level logic: ANDs followed by ORs
- Example: $Y=\bar{A} \bar{B} \bar{C}+A \bar{B} \bar{C}+A \bar{B} C$

## Circuit Schematics Rules

- Inputs on the left (or top)
- Outputs on right (or bottom)
- Gates flow from left to right
- Straight wires are best

## Circuit Schematic Rules (cont.)

- Wires always connect at a T junction
- A dot where wires cross indicates a connection between the wires
- Wires crossing without a dot make no connection

|  |  | wires crossing |
| :---: | :---: | :---: |
| wires connect | wires connect | without a dot do |
| at a T junction | at a dot | not connect |

## Contention: X: Simulation:

- Contention: circuit tries to drive output to 1 and 0
- Actual value somewhere in between
- Could be 0,1 , or in forbidden zone
- Might change with voltage, temperature, time, noise
- Often causes excessive power dissipation

$$
\begin{aligned}
& A=1-D_{0}-Y=X \\
& B=0-D_{0}
\end{aligned}
$$

- Warnings:
- Contention usually indicates a bug.
- X is used for "don't care" and contention - look at the context to tell them apart

## Floating: Z

- Floating, high impedance, open, high Z
- Floating output might be 0,1 , or somewhere in between
- A voltmeter won't indicate whether a node is floating Tristate Buffer

| $E$ | $A$ | $Y$ |
| :---: | :---: | :---: |
| 0 | 0 | $Z$ |
| 0 | 1 | $Z$ |
| 1 | 0 | 0 |
| 1 | 1 | 1 |

## Tristate Busses

- Floating nodes are used in tristate busses
- Many different drivers
- Exactly one is active at once

## Karnaugh Maps (K-Maps)

- Boolean expressions can be minimized by combining terms
- K-maps minimize equations graphically
- $P A+P \bar{A}=P$

## K-Map Definitions

- Complement: variable with a bar over it $\bar{A}, \bar{B}, \bar{C}$
- Literal: variable or its complement $\bar{A}, A, \bar{B}, B, C, \bar{C}$
- Implicant: product of literals $A \bar{B} C, \bar{A} C, B C$
- Prime implicant: implicant corresponding to the largest circle in a K-map

## K-Map Rules

- Every 1 must be circled at least once
- Each circle must span a power of 2 (i.e. 1, 2, 4) squares in each direction
- Each circle must be as large as possible
- A circle may wrap around the edges
- A "don't care" $(\mathrm{X})$ is circled only if it helps minimize the equation

## Combinational Building Blocks

- Multiplexers
- Decoders

## Multiplexer (Mux)

- Selects between one of $N$ inputs to connect to output
- $\log _{2} \mathrm{~N}$-bit select input - control input
- Example:

2:1 Mux

| $S$ | $D_{1}$ | $D_{0}$ | $Y$ |  | $S$ | $Y$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 0 | 0 |  | 0 | $D_{0}$ |
| 0 | 0 | 1 | 1 |  | 1 | $D_{1}$ |
| 0 | 1 | 0 | 0 |  |  |  |
| 0 | 1 | 1 | 1 |  |  |  |
| 1 | 0 | 0 | 0 |  |  |  |
| 1 | 0 | 1 | 0 |  |  |  |
| 1 | 1 | 0 | 1 |  |  |  |
| 1 | 1 | 1 | 1 |  |  |  |

## Multiplexer Implementations

## - Logic gates

- Sum-of-products form

$$
Y=D_{0} \bar{S}+D_{1} S
$$

## Logic using Multiplexers

## - Using the mux as a lookup table

## Logic using Multiplexers

- Reducing the size of the mux

## Decoders

- $N$ inputs, $2^{N}$ outputs
- One-hot outputs: only one output HIGH at once

| $A_{1}$ | $A_{0}$ | $Y_{3}$ | $Y_{2}$ | $Y_{1}$ | $Y_{0}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 1 |
| 0 | 1 | 0 | 0 | 1 | 0 |
| 1 | 0 | 0 | 1 | 0 | 0 |
| 1 | 1 | 1 | 0 | 0 | 0 |

## Decoder Implementation

## Logic Using Decoders

## - OR minterms

## Timing

- Delay between input change and output changing
- How to build fast circuits?

Time

## Propagation \& Contamination Delay

- Propagation delay: $t_{p d}=$ max delay from input to output
- Contamination delay: $t_{c d}=$ min delay from input to output

Time

## Propagation \& Contamination Delay

- Delay is caused by
- Capacitance and resistance in a circuit
- Speed of light limitation
- Reasons why $t_{p d}$ and $t_{c d}$ may be different:
- Different rising and falling delays
- Multiple inputs and outputs, some of which are faster than others
- Circuits slow down when hot and speed up when cold

## Critical (Long) \& Short Paths

## Critical Path

## Critical (Long) Path: $t_{p d}=2 t_{p d_{-} \mathrm{AND}}+t_{p d_{-} \mathrm{OR}}$ Short Path: $t_{c d}=t_{c d \_ \text {AND }}$
